This edited book provides a global view on evolution education. It describes the state of evolution education in different countries that are representative of geographical regions around the globe such as Eastern Europe, Western Europe, North Africa, South Africa, North America, South America, Middle East, Far East, South East Asia, Australia, and New Zealand. Studies in evolution education literature can be divided into three main categories: (a) understanding the interrelationships among cognitive, affective, epistemological, and religious factors that are related to peoples' views about evolution, (b) designing, implementing, evaluating evolution education curriculum that reflects contemporary evolution understanding, and (c) reducing antievolutionary attitudes. This volume systematically summarizes the evolution education literature across these three categories for each country or geographical region. The individual chapters thus include common elements that facilitate a cross-cultural meta-analysis. Written for a primarily academic audience, this book provides a much-needed common background for future evolution education research across the globe.

Bernard R. Gifford As we edge toward the year 2000, the information age is a reality; the global marketplace is increasingly competitive; and the U.S. labor force is shrinking. Today more than ever, our nation's economic and social well-being hinges on our

ability to tap our human resources-to identify talent, to nurture it, and to assess abilities and disabilities in ways that help every individual reach his or her full potential. In pursuing that goal, decision-makers in education, industry, and government are relying increasingly on standardized tests: sets of question-with identical directions, time limits and tasks for all test-takers-designed to permit an inference about what someone knows or can do in a particular area.

CALIBRATING DIFFERENCE Our emphasis on standardized testing rests on a premise that is so basic it often escapes notice: that we humans are different from each other in ways that are both meaningful and measurable. We differ in terms of cognitive ability; aptitude for performing different kinds of mental and physical tasks; temperament; and interests. But somehow, without sufficient examination, we have taken a great collective leap from that commonplace to the notion that there are precise, measurable gradations of innate ability that can be used to direct children to the right classrooms, and adults to the right job slots.

This text presents mathematical biology as a field with a unity of its own, rather than only the intrusion of one science into another. The book focuses on problems of contemporary interest, such as cancer, genetics, and the rapidly growing field of genomics.

Ecology, biodiversity and conservation are interrelated fields of study concerned with assessing, evaluating and maintaining the ecological balance of our planet. The focus areas of ecology and biodiversity are planning and management of natural

resources, biodiversity maintenance as well as sustaining genetic diversity for wildlife species conservation. The interdisciplinary branches of evolutionary ecology, biology, genetics and ethology are studied to formulate conservation methodologies. This book provides the latest research and technological advancements in the field of ecology, biodiversity and conservation. It strives to provide significant knowledge on these frontiers and help to develop a holistic understanding of these fields. The book is appropriate for students seeking detailed information in this area as well as for experts, ecologists, environmentalists and conservationists.

A new edition of the classic study of the relationship between predator and prey follows the life cycles of the wolves in Michigan's Isle Royale National Park and the mood on the island, offering a firsthand account of the nearly fifty-year wildlife study, complemented by more than one hundred color photographs.

Biology is a source of fascination for most scientists, whether their training is in the life sciences or not. In particular, there is a special satisfaction in discovering an understanding of biology in the context of another science like mathematics. Fortunately there are plenty of interesting (and fun) problems in biology, and virtually all scientific disciplines have become the richer for it. For example, two major journals, *Mathematical Biosciences* and *Journal of Mathematical Biology*, have tripled in size since their inceptions 20-25 years ago. The various sciences have a great deal to give to one another, but there

are still too many fences separating them. In writing this book we have adopted the philosophy that mathematical biology is not merely the intrusion of one science into another, but has a unity of its own, in which both the biology and the mathematics should be equal and complete, and should flow smoothly into and out of one another. We have taught mathematical biology with this philosophy in mind and have seen profound changes in the outlooks of our science and engineering students: The attitude of "Oh no, another pendulum on a spring problem!," or "Yet one more LCD circuit!" completely disappeared in the face of applications of mathematics in biology. There is a timeliness in calculating a protocol for administering a drug.

“We share a common bond with even the most bizarre beetle of the Peruvian rain forest,” asserts John Janovy Jr. “A belief in that common bond might, in fact, be the most fundamental characteristic of a biologist.” And biologists see the worth of a plant or an animal not in monetary terms but in its contribution to our understanding of life. The famous naturalist brings a humanist’s vision to this superbly written book. *Becoming a Biologist* is grounded in reality, cognizant of practical matters (education and jobs) as well as the ideals that inform the profession—a reverence for life and a responsibility to humankind and its future. Janovy draws on his experiences as a graduate and postdoctoral student, on his rewarding relationships with teachers, and on his fieldwork as a naturalist. This edition includes new information throughout the book regarding pertinent events, issues, and changes in technology.
