Approaches to the Study of History. Historians such as Richard Lim and D. K. Smith (2003) have argued that the study of history necessitates more than the mere recording (and memorization) of dates, people and events. It demands interpretation and necessitates invariably a degree of subjectivity in the process of analysis; no student of the past encounters historical materials or ideas or "facts" without a myriad assortment of beliefs, values, expectations, and constructs which naturally ...

Theologians adopt a more content-based approach: they study the texts and dogma which capture our fundamental dependence on a greater order of things. Intellectual historians and students of political thought study religious traditions as coherent, inter-generational, scholarly bodies of thought — the "Islamic" or the "Christian" or the "Confucian" tradition, for example.

Religion and 'The Study of Religions' has many approaches which try to investigate the core of what religion is and what it means to the people who practice it. Sociology is one such approach that this essay will be looking at through its founding fathers Emile Durkheim, Max Weber and Karl Marx.

In this fundamental analysis, Rapoport asks: Why do we have wars? Doesn't humanity always seem on the verge of self-annihilation? Is there something in human genetic structure that makes people want to kill each other? Perhaps this impulse is a matter of good versus evil, or just plain human nature. Rapoport moves beyond cliches by claiming that the sources of modern violence reside in the imbalance between a lag in the system of values inherited from the past and the structure of science and technology that awaits no revision of values to move ahead. As a result, Rapoport argues that the study of war and peace should be considered a science, just like biology or, for that matter, political science. The same rules of empirical engagement and experimentation should apply. Before we can have a theory of peace, we need a methodology of conflict. Using the writings of thinkers who have made significant contributions to the predominant ideas and ideals of our society, Rapoport weaves together the strands of independent thought and research into a single, thought-provoking work. After investigating the whys of violence, using ideological, psychological, strategic, and systemic perspective, Rapoport moves to an in-depth analysis of possible varieties of conflict resolution. He explores such mechanisms as mediation, education, and applying the results of scientific research. He documents the impact of ideologies countervailing dominant ones that place obstacles in the way of peacemaking. Rapoport argues that conciliation and game theories can be utilized to replace the concept of winner take all or total victory. The Origins of Violence is a needed contribution to our understanding of warfare, and provides a forward-looking perspective that can be of wide use to each of the policy sciences, starting with military strategy and ending with international development.

Investigating the brain "from the outside" using brain scanning technology, such as PET and fMRI, bring great precision to results. However, examining the "view from within" the brain isn't so easy. This book presents results of investigations, that examines the conscious mind "from the inside."

Essay from the year 2006 in the subject Politics - International Politics - General and Theories, London School of Economics (Department of International Relations), language: English, abstract: Since the behaviourist turn of the 1960s, questions concerning the appropriateness and desirability of a positivist research agenda have been at the forefront of meta-methodological debate within the social sciences. The evolving 'science wars' between positivists and normativists have also presented enormous challenges to the epistemological identities and professional self-images of scholars working in the academic field of International Relations (IR). Whereas positivists maintain that the overarching aim of science is the experimentally guided explanation of empirical phenomena under 'covering laws', normativists and traditionalists hold that social scientists cannot - and, in fact, should not - emulate the causal models of the natural sciences. According to this view, it is virtually impossible to study the influences of distinct variables in complex social interactions, and statistical aggregation merely obscures the fact that the true 'causes' of events are rarely obvious in the social world. Hence, the purpose of political and social research ought to be a desire to understand processes 'from within' rather than to explain them 'from outside'. Yet the traditionalist critique of social scientific positivism did not imply that positivists would be entirely oblivious to the importance of norms in international life. IR does not only deal with descriptive, but with political (and, ultimately, prescriptive) aspects of the social world. Thus, it might appear worthwhile to ask: how scientific are so-called 'scientific' (positivist) approaches to the study of IR - if their theoretical premises and empirical achievements are taken at face value and judged by their own standards of 'scientific' neutrality and precision? To answer this question, I will first describe the sp

It has been argued that religious studies is a polymethodic discipline, and that the student of religion should be familiar with the approaches of the major disciplines concerned with understanding the nature of religion, not least because the approach adopted has profound influence on the phenomena chose for investigation and the conclusions reached. This book is the first textbook, specifically designed for undergraduate students, that provides the essential background on methods of the major relevant disciplines. Presenting each of the significant approaches to religion in an informed manner, the book brings together experienced researchers from feminism, anthropology, sociology, phenomenology, psychology, philosophy, and theology. It presents a consistent approach throughout, with each chapter dealing with the same themes: the historical development of the approach, the characteristics of the approach, and the surrounding issues and debates.

significant—and long overdue—contribution to the development of the field. The contributors argue that, far from being overly abstract, critical tools and methods are central to contemporary scholarship and can have practical policy implications when brought to the study of higher education. They argue that critical research design and critical theories help scholars see beyond the normative models and frameworks that have long limited our understanding of students, faculty, institutions, the organization and governance of higher education, and the policies that shape the postsecondary arena. A rigorous and invaluable guide for researchers seeking innovative approaches to higher education and the morass of traditionally functionalist, rational, and neoliberal thinking that mars the field, this book is also essential for instructors who wish to incorporate the lessons of critical scholarship into their course development, curriculum, and pedagogy.

The aim of this volume is to raise and discuss questions about the different approaches to the study of pre-modern Arabic anthologies from the perspectives of philology, religion, history, geography, and literature.
