The Navy has put forth a new construct for its strike forces that enables more effective forward deterrence and rapid response. A key aspect of this construct is the need for flexible, adaptive command, control, communications, computers, intelligence, surveillance, and reconnaissance (C4ISR) systems. To assist development of this capability, the Navy asked the NRC to examine C4ISR for carrier, expeditionary, and strike and missile defense strike groups, and for expeditionary strike forces. This

# Download Free C4isr Systems Command Control

report provides an assessment of C4ISR capabilities for each type of strike group; recommendations for C4ISR architecture for use in major combat operations; promising technology trends; and an examination of organizational improvements that can enable the recommended architecture.

Rapid progress in information and communications technologies is dramatically enhancing the strategic role of information, positioning effective exploitation of these technology advances as a critical success factor in military affairs. These technology advances are drivers and enablers for the "nervous system" of the military — its command, control, communications, computers, and intelligence (C4I) systems — to more

# Download Free C4isr Systems Command Control

effectively use the "muscle" side of the military. Authored by a committee of experts drawn equally from the military and commercial sectors, *Realizing the Potential of C4I* identifies three major areas as fundamental challenges to the full Department of Defense (DOD) exploitation of C4I technology: information systems security, interoperability, and various aspects of DOD process and culture. The book details principles by which to assess DOD efforts in these areas over the long term and provides specific, more immediately actionable recommendations. Although DOD is the focus of this book, the principles and issues presented are also relevant to interoperability, architecture, and security challenges faced by government as a whole and by large, complex public and private enterprises across the economy.

In an effort to focus limited Department of Defense (DoD) resources, the U.S. Army has chosen to utilize commercially available systems and equipment to meet its military requirements for the future. Radically increased lethality and mobility, wide disparities in the size and nature of conflicts, expansive urbanization and a global information environment will characterize the future military environment. The US Army's vision for the future is that everyone in the battlespace can interact at anytime using all the tools necessary to convey thoughts, orders, or plans to any system, mounted or dismounted; on the battlespace in real time. The day of separate land, sea and air operations is gone forever. Operations will be joint service and certainly include multinational components.

Shortly after the events of September 11,

2001, the U.S. Army asked the National Research Council (NRC) for a series of reports on how science and technology could assist the Army meet its Homeland defense obligations. The first report, Science and Technology for Army Homeland Security â€" Report 1, presented a survey of a road range of technologies and recommended applying Future Force technologies to homeland security wherever possible. In particular, the report noted that the Army should play a major role in providing emergency command, control, communications, computers, intelligence, surveillance, and reconnaissance (C4ISR) capabilities and that the technology and architecture needed for homeland security C4ISR was compatible with that of the Army â€™s Future Force. This second report focuses on C4ISR and how it can facilitate the Army â€™s efforts to assist the Department of Homeland Security

"The current and planned command and control communications, computers, intelligence, surveillance, and reconnaissance (C4ISR) systems for existing and future aircraft weapon systems are inadequate to support commanders on the contemporary battlefield and inconsistent with Service requirements particularly while conducting counterinsurgency operations. Historically, the demand for information in the military has increased ahead of the technological capability to provide adequate services. Future battlefields will continue this paradigm. In order to achieve information

# Download Free C4isr Systems Command Control

dominance, C4ISR requirements must be met in every combat and support aircraft planned by the military Services." --Abstract from web site.

This paper addresses the influences and process that Space and Naval Warfare (SPAWAR) Systems Command uses to introduce the latest Command, Control, Communications, Computers, Intelligence, Sensors, Reconnaissance and Information Warfare (C4ISR/IW) technologies to Naval Shipbuilding. This technology insertion affects both individual ships C4ISR/IW capability and that of the entire Battle Group/Amphibious Readiness Group (BG/ARG).

We evaluated DOD'S progress in implementing certain key information superiority activities to provide an indication of how well DOD is progressing

# Download Free C4isr Systems Command Control

toward its information superiority goals. Specifically, we evaluated DOD'S progress in establishing a DOD wide architecture for the information systems known as Command, Control, Communications, Computers (C4), Intelligence, Surveillance, and Reconnaissance (C4ISR) systems; developing and implementing the Global Command and Control System (GCCS); and establishing the Joint Tactical Radio System (JTRS).
