The concepts of cytology and genetics were combined together to form the science of Cytogenetics. This fusion came about with realization that “ units ” or “ factors ” (genes) that govern different characters were in fact situated in the chromosomes.

Cytogenetics is essentially a branch of genetics, but is also a part of cell biology/cytology (a subdivision of human anatomy), that is concerned with how the chromosomes relate to cell behaviour, particularly to their behaviour during mitosis and meiosis. Techniques used include karyotyping, analysis of G-banded chromosomes, other cytogenetic banding techniques, as well as molecular ...

The reference to cytology in the title is perhaps slightly misleading, for, except in a single chapter on the generalized cell, only those aspects of general cytology concerned with the nucleus receive attention. This limitation however does not detract from the merits of a book whose main theme is cytogenetics. The contents fall into three parts.

Dr Swanson's book is an extensive survey of all those parts of cytology having connection with genetics. This means in fact a very detailed account of the structure, composition and behaviour of the chromosomes, for though the other components of the cell—the cytoplasm, mitochondria, etc.—are mentioned in Chapter 2, they scarcely appear again.

Abstract The diagnosis of transitional cell carcinoma (TCC) in bladder washes is a diagnostic challenge to cytology. This study assessed the role of flow cytometry (FCM), image analysis (IA), and interphase cytogenetics by fluorescence in situ hybridization (FISH) as adjuncts in the cytodiagnosis of TCC in bladder washes.
