Correct answer: $\frac{y^6}{2x^3z^2}$ Explanation: When dividing with exponents, the exponent in the denominator is subtracted from the exponent in the numerator. For example: $\frac{x^3}{x^6} = x^{3-6} = x^{-3} = \frac{1}{x^3}$.

Exponents may seem like advanced math —like some mysterious code with a complicated meaning. In fact, though, an exponent is just short hand for saying that you 're multiplying a number by itself two or more times. For instance, instead of saying that you 're multiplying $5 \times 5 \times 5$, you can show that you 're multiplying 5 by itself 3 times if you just write 5^3 . We usually say this as “ five to the third power ” or “ five to the power of three. ” .
