Industrial production in high-wage countries like Germany is still at risk. Yet, there are many counter-examples in which producing companies dominate their competitors by not only compensating for their specific disadvantages in terms of factor costs (e.g. wages, energy, duties and taxes) but rather by minimising waste using synchronising integrativity as well as by obtaining superior adaptivity on alternating conditions. In order to respond to the issue of economic sustainability of industrial production in high-wage countries, the leading production engineering and material research scientists of RWTH Aachen University together with renowned companies have established the Cluster of Excellence "Integrative Production Technology for High-Wage Countries". This compendium comprises the cluster's scientific results as well as a selection of business and technology cases, in which these results have been successfully implemented into industrial practice in close cooperation with more than 30 companies of the industrial production sector.

In 2018, one of the largest new museum buildings in Germany was opened in Mannheim, designed by the architects von Gerkan, Marg und Partners. Owing to its unique facade, which is characterised by a bronze-coloured metal mesh, the new building of the Kunsthalle Mannheim integrates confidently into the surroundings. It links up with the historical museum building and has been designed as a 'city in the city', offering visitors interesting circuits with varying insights and views out. The centrepiece and prelude to the new building is formed by the freely accessible central atrium. In this volume of the gmp focus series, the architects illuminate their design and grant an insight into the challenges of the building task. In addition, architectural critic Jurgen Tietz examines in an essay why museums like the Kunsthalle Mannheim are still needed today. Text in English and German.

The book presents papers from leading proponents of realist, relativist, and constructivist positions in epistemology and the philosophy of language and ethics.

Modern labour markets are characterised by the high levels of flexibility they demand of workers and unemployed individuals in particular. Increasing the willingness of jobseekers for regional mobility is an integral part of this development and was at the heart of the far reaching Hartz reforms of the German labour market in the early 2000s. Within this context, this research assesses the role regional mobility plays in the job search of unemployed individuals. Based on innovative experimental designs, rich administrative and survey data and state-of-the-art econometric analysis, Sebastian Bähr contributes to the ongoing debate on flexibility induced inequality in the labour market.

A quick and easy reference to get the most out of your Android tablet It's not a computer and it's not a smartphone—so what in the world is it? Whether you're new to Android or new to tablets altogether, you're about to experience mobile computing like never before with this fun, full-color guide! In Android Tablets For Dummies, you'll find clear, easy-to-follow explanations for making sense of all the features native to Android tablets, as well as model-specific guidance. Inside, trusted tech guru Dan Gookin—who wrote the very first For Dummies book in 1991—walks you through setting up your Android tablet, navigating the interface, browsing the web, setting up email, finding the best apps, and so much more. No matter which Android tablet tickles your fancy, this hands-on guide takes the intimidation out of the technology and gives you everything you need to make the most of your new device. Set up your tablet, configure the Home screen, and get connected Surf the web, send and receive email and texts, and use video chat and social media to keep in touch with family and friends Have fun with photos, videos, games, eBooks, music, and movies Get up and running with the Nougat Operating System If you're eager to learn the ins and outs of your Android device—but don't want to pull your hair out in the process—this one-stop guide has you covered.

Popular, controversial, inspiring and irritating, Hans Eysenck was a man of paradoxes and contradictions. This intriguing and highly readable biography examines the life and work of the influential psychologist and places them within the scientific, historical, social and political contexts.

"What good is a newborn baby?" Michael Faraday's reputed response when asked, "What good is magnetic induction?" But, it must be admitted that a newborn baby may die in infancy. What about this one- the idea of transfiniteness for graphs, electrical networks, and random walks? At least its bloodline is robust. Those subjects, along with Cantor's transfinite numbers, comprise its ancestry. There seems to be general agreement that the theory of graphs was born when Leonhard Euler published his solution to the "Konigsberg bridge prob lem" in 1736 [8]. Similarly, the year of birth for electrical network theory might well be taken to be 184 7, when Gustav Kirchhoff published his volt age and current laws [ 14]. Ever since those dates until just a few years ago, all infinite undirected graphs and networks had an inviolate property: Two branches either were connected through a finite path or were not connected at all. The idea of two branches being connected only through transfinite paths, that is, only through paths having infinitely many branches was never invoked, or so it appears from a perusal of various surveys of infinite graphs [1 7], [20], [29], [32]. Our objective herein is to explore this idea and some of its ramifications. It should be noted however that directed graphs having transfinite paths have appeared in set theory [6, Section 4.

'This book, aimed at graduate students and researchers in the theory of algorithms, succeeds admirably in describing the fundamental ideas in the field.' - Computing Reviews This monograph studies two classical computational problems: counting the elements of a finite set of combinatorial structures, and generating them at random from some probability distribution. Apart from their intrinsic interest, these problems arise naturally in many branches of mathematics and the natural sciences. The author aims to classify the computational difficulty of these problems for various naturally occurring structures: the emphasis is on positive results that demonstrate the existence of efficient algorithms. At the heart of the monograph is a single algorithmic paradigm: simulate a Markov chain whose states are combinatorial structures. A major portion of the monograph is devoted to developing new mathematical tools for the analysis of algorithms of this kind. Among the applications presented are the first provably efficient algorithms for several important counting and generation problems. Further applications are summarized in an appendix. This book will be of interest to researchers and graduate students in theoretical computer science, probability and statistics and theoretical physicists with an interest in Monte Carlo methods. It is a timely contribution to a fast moving field, with the immediacy and freshness of a new discovery. Contents Synopsis 1. Direct Applications 3.1 Some simple examples 3.2 Approximating the permanent 3.3 Monomer-dimer systems 3.4 Concluding remarks 4. Indirect Applications 4.1 A robust notion of approximate counting 4.2 Self-embeddable relations 4.3 Graphs with specified degrees Appendix: Recent developments Bibliography Series: Progress in Theoretical Computer Science

Des Freedman explores Labour's divided response to the development of commercial television in the 1950s and assesses the impact of Wilson's governments on television in the 1960s. His key argument is that Labour has always been a vigorous but ultimately unreliable advocate of television.
