Introduction To Sockets Programming In  
Socket programming in C++ is the way of combining or connecting two nodes with each other over a network so that they can communicate easily without losing any data. If we take a real-life example then the socket we see in reality is a medium to connect two devices or systems.

Socket Programming is used for communication between machines using a Transfer Control Protocol (TCP). It can be connectionless or connection-oriented. ServerSocket and Socket classes are used for connection-oriented socket programming. After creating a connection, the server develops a socket object on its end of the connection.

Socket programming is a way of connecting two nodes on a network to communicate with each other. One socket (node) listens on a particular port at an IP, while other socket reaches out to the other to form a connection. Server forms the listener socket while client reaches out to the server. A socket is an endpoint used by a process for bi-directional communication with a socket associated with another process. Sockets, introduced in Berkeley Unix, are a basic mechanism for IPC on a computer system, or on different computer systems connected by local or wide area networks (resource 2).

To a programmer, a socket looks and behaves much like a low-level file descriptor. This is because commands such as read () and write () work with sockets in the same way they do with files and pipes. Sockets were first introduced in 2.1BSD and subsequently refined

What is a Socket? - Tutorialspoint  
Background # Sockets have a long history. Their use originated with ARPANET in 1971 and later became an API in the Berkeley Software Distribution (BSD) operating system released in 1983 called Berkeley sockets. When the Internet took off in the 1990s with the World Wide Web, so did network programming.

The 32 bits of an IPv4 address are broken into 4 octets, or 8 bit fields (0-255 value in decimal notation). For networks of different size, the first one (for large networks) to three (for small networks) octets can be used to identify the network, while the rest of the octets can be used to identify the node on the network.

Let's now do some server tasks with sockets .  
Server Programming. OK now onto server  
things. Servers basically do the following :  
1. Open a socket 2. Bind to a address (and  
port). 3. Listen for incoming connections. 4.  
Accept connections 5. Read/Send. Bind a  
socket. `socket_bind` can be used to bind a  
socket to a particular address and port. It  
needs a `sockaddr_in` structure similar to  
`connect` function.
