A stepper motor, also

known as step motor or stepping motor, is a brushless DC electric motor that divides a full rotation into a number of equal steps. The motor's position can then be commanded to move and hold at one of these steps without any position sensor for feedback, as long as the motor is

carefully sized to the application in respect to torque and speed. Switched reluctance motors are very large stepping motors with a reduced pole count, and generally are closed-loop commutated.

the number-1 factor to consider about a stepper motor is its Resolution! The resolution of a stepper motor is the number of degrees it rotates per step (degrees/step). The most used stepper motors have $7.5^\circ/\text{step}$ and $1.8^\circ/\text{step}$. The unipolar motor which

we'll be using has a resolution of $7.5^\circ/\text{step}$.
