The major purpose of this research is to provide a computer aided analysis and design capability for microwave reflector antenna systems, in the 1-40 GHz range. This capability will allow for the prediction of antenna gain and antenna temperature performance of reflector antennas, under various atmospheric conditions.

Flat-panel technology could transform antennas, wireless and cell phone communications Electronically controlled 2-D reflector promises improved microwave communications, beam steering without moving pieces, and one-way microwave mirrors March 20, 2020 What goes in is not what comes out with a spatio-temporally modulated metasurface reflector.

Flat-panel technology could transform antennas, wireless ...  
Reflector antennas are widely used in radars, radio astronomy, satellite communication and tracking, remote sensing, deep space communication, microwave and millimetre wave communications, and so forth [1-3]. The rapid developments in these fields have created demands for development of sophisticated reflector antenna configurations.

A New Method of Designing Circularly Symmetric Shaped Dual ...  
For both receiving and transmitting it is necessary to match the impedance of a microwave antenna to the feed line for efficient operation. Let us consider a typical antenna consisting of a dipole mounted in a parabolic dish reflector. The position of the antenna in the dish is set for maximum gain and minimum side lobes.

C band horn-reflector antennas on the roof of a telephone switching center in Seattle, Washington, part of the U.S. AT&T Long Lines microwave relay network. A microwave antenna is a physical transmission device used to broadcast microwave transmissions between two or more locations. [1]

Microwave antenna - Wikipedia  
The optically transparent antenna consists of a radiation patch and a ground plane fabricated using AgHT-8. The antenna design comprises of rectangular shaped branches optimized to attain the wideband characteristics. The proposed antenna design has impedance bandwidth of 58.71% covering the frequency range of 23.92-43.8 GHz.

Compact wideband transparent antenna for 5G communication ...  
The dipole antenna is the most fundamental and simplest antenna and was, historically, the first to be used as a reflector feed. To illuminate the reflector efficiently, a small circular disc was used as a subreflector to direct the dipole radiation toward the reflector. An oversized dipole reflector has also been used in place of the disc reflector.
