Numerical Heat Transfer

Numerical heat transfer is a broad term denoting the procedures for the solution, on a computer, of a set of algebraic equations that approximate the differential (and, occasionally, integral) equations describing conduction, convection and/or radiation heat transfer.

Numerical Heat Transfer

The three-dimensional (3D) governing equations for both liquid flow and heat transfer are solved using a standard finite volume method (FVM) for the range of Reynolds number between 4000 and 7000. The standard $k-\epsilon$ turbulence model with wall function is employed.

Heat-transfer fluid is the key for

Download File PDF

Numerical Heat Transfer

transforming solar energy into heat.

Currently used heat-transfer medium are typically fluids, mainly including water/steam, heat-transfer oil, molten salt, air, and the like. Furthermore, ceramic solid particles can be used as a heat-transfer medium for the fluidized bed receiver.
