Abstract Prostate cancer (PrCa) is one of the most common cancers in men, but little is known about factors affecting its clinical outcomes. Genome-wide association studies (GWAS) have identified several susceptibility loci for prostate cancer. One of the most significant loci is on chromosome 17q21.31, which contains the *BRCA1* gene. This region is also associated with other complex traits, including height, educational attainment, and schizophrenia. The discovery of this locus has led to a better understanding of the genetic architecture of prostate cancer and its relationship to other complex traits.
