$k = 1$, the likelihood equation yields the solution $\hat{\theta}^* ML(y) = \frac{1}{n} \sum_{k=1}^n y_k - 1$, which is seen to yield a maximum of the likelihood function. d. We have $E \hat{\theta}^* ML(Y) = \frac{1}{n} \sum_{k=1}^n E y_k = 1 - \theta$. Similarly, since the Y_k s are independent, $Var \hat{\theta}^* ML(Y) = \frac{1}{n^2} \sum_{k=1}^n Var y_k = \frac{1}{n^2} \sum_{k=1}^n 2(1+\theta)^2 = \frac{2(1+\theta)}{n}$.

An Introduction to Signal Detection and Estimation—

This book is primarily designed for the study of statistical signal detection and parameter estimation. Such concepts require a good knowledge of the fundamental notions on probability, random variables, and stochastic processes. In Chapter 1, we present concepts on probability and random variables.
