The slow drain device could be a host, storage or connected switch. For some reason, the frames they accepted exceeded their capabilities so that they could not return enough buffer credits to uplink devices, which causes network delay, congestion or even frame lose issue. All of these would lead to performance issue. The bottleneck device could either be at physical layer, such as SFP, fiber cable and endpoint device, or a SAN design defect, for example, the actual data volume exceeds the ...
