Diphtheria toxin is produced by C. diphtheriae only when infected with a bacteriophage that integrates the toxin-encoding genetic elements into the bacteria. [20] [21] Diphtheria toxin is a single, 60-kDa- molecular weight protein composed of two peptide chains, fragment A and fragment B, held together by a disulfide bond .

diphtheria | Definition, Causes, Symptoms, Prevention ...

Diphtheria is a disease caused by strains of Corynebacterium diphtheriae, which make diphtheria toxin, a binary toxin consisting of two molecular components: fragments A and B. Fragment B binds to the target cell and allows access of fragment A to the cytoplasm. Fragment A inactivates elongation factor-2 (EF-2), inhibiting protein synthesis in the cell, causing necrosis.

Corynebacterium diphtheriae - an overview | ScienceDirect ...

Three species of diphtheria bacteria produce toxins that are able to cause severe disease. Corynebacterium diphtheriae is the most infectious of these bacteria, and also the most common globally. Corynebacterium ulcerans is less common; it can cause classic diphtheria symptoms as well as a form of diphtheria that affects the skin and causes ulcers. This form of diphtheria usually occurs in countries where it is difficult to practise good hygiene.
