Provides a variety of projects and lessons to teach elementary students about the workings of the human body.

EARLY BIRD BODY SYSTEMS TEACHING GUIDE

Relative Truth, Ultimate Truth is a clear and remarkably practical presentation of a core Buddhist teaching on the nature of reality. Geshe Tashi Tsering provides readers with an excellent opportunity to enhance not only thier knowledge of Buddhism, but also a powerful means to profoundly enhance their view of the world. The Buddhist teaching of the'two truths' is the gateway to understanding the often-misunderstood philosophy of emptiness. This volume is an excellent source of support for anyone interested in cultivating a more holistic and transformative understanding of the world around them and ultimately of their own consciousness

Can health-care costs be reduced by increasing the overall level of physical activity? What part does heredity play in physical fitness? How does exercise affect the immune system? What is the relationship between physical activity and hypertension?

Explains how choices about food, nutrition, and lifestyle affect you and how to have a healthy lifestyle.

A survey of probabilistic approaches to modeling and understanding brain function. Neurophysiological, neuroanatomical, and brain imaging studies have helped to shed light on how the brain transforms raw sensory information into a form that is useful for goal-directed behavior. A fundamental question that is seldom addressed by these studies, however, is why the brain uses the types of representations it does and what evolutionary advantage, if any, these representations confer. It is difficult to address such questions directly via animal experiments. A promising alternative is to use probabilistic principles such as maximum likelihood and Bayesian inference to derive models of brain function. This book surveys some of the current probabilistic approaches to modeling and understanding brain function. Although most of the examples focus on vision, many of the models and techniques are applicable to other modalities as well. The book presents top-down computational models as well as bottom-up neurally motivated models of brain function. The topics covered include Bayesian and information-theoretic models of perception, probabilistic theories of neural coding and spike timing, computational models of lateral and cortico-cortical feedback connections, and the development of receptive field properties from natural signals.

Discusses the history of food labeling and explains how to use the label's information on food composition to create a balanced diet.

Simple text and photographs introduce the muscular system and its purpose, parts, and functions.
