Computation is defined as usual except that the head never encounters an end to the tape as it moves leftward. Show that this type of Turing machine recognizes the class of Turing-recognizable languages. **Solution:** we simulate a doubly-infinite TM with an ordinary one with 2 tapes (which is equivalent to single-tape TMs). The first tape starts with the input string, and the second is blank.

Purpose of the Theory of Computation: Develop formal mathematical models of computation that reflect real-world computers. This field of research was started by mathematicians and logicians in the 1930s, when they were trying to understand the meaning of a computation. A central question asked was whether all mathematical problems can be

If  $w$  has an odd number of 1's, then so does  $z$ . By the  
inductive hypothesis,  $\hat{\delta}(A,z) = B$ , and the transitions of the  
DFA tell us  $\hat{\delta}(A,w) = B$ . Thus, in this case,  $\hat{\delta}(A,w) = A$  if  
and only if  $w$  has an even number of 1's. Case 2:  $a = 1$ . If  $w$   
has an even number of 1's, then  $z$  has an odd number of 1's.
