"Military historian and Civil Air Patrol (CAP) member Frank A. Blazich Jr. collects oral and written histories of the CAP's short-lived—but influential—coastal air patrol operations of World War II and expands it in a scholarly monograph that cements the legacy of this vital civil-military cooperative effort"--

Sensors are everywhere. Small, flexible, economical, and computationally powerful, they operate ubiquitously in environments. They compile massive amounts of data, including information about air, water, and climate. Never before has such a volume of environmental data been so broadly collected or so widely available. Grappling with the consequences of wiring our world, Program Earth examines how sensor technologies are programming our environments. As Jennifer Gabrys points out, sensors do not merely record information about an environment. Rather, they generate new environments and environmental relations. At the same time, they give a voice to the entities they monitor: to animals, plants, people, and inanimate objects. This book looks at the ways in which sensors converge with environments to map ecological processes, to track the migration of animals, to check pollutants, to facilitate citizen participation, and to program infrastructure. Through discussing particular instances where sensors are deployed for environmental study and citizen engagement across three areas of environmental sensing, from wild sensing to pollution sensing and urban sensing, Program Earth asks how sensor technologies specifically contribute to new environmental conditions. What are the implications for wiring up environments? How do sensor applications not only program environments, but also program the sorts of citizens and collectives we might become? Program Earth suggests that the sensor-based monitoring of Earth offers the prospect of making new environments not simply as an extension of the human but rather as new "technogeographies" that connect technology, nature, and people.

In a world where waste incinerators are not an option and landfills are at over capacity, cities are hard pressed to find a solution to the problem of what to do with their solid waste. Handbook of Solid Waste Management, 2/e offers a solution. This handbook offers an integrated approach to the planning, design, and management of economical and environmentally responsible solid waste disposal system. Let twenty industry and government experts provide you with the tools to design a solid waste management system capable of disposing of waste in a cost-efficient and environmentally responsible manner. Focusing on the six primary functions of an integrated system—source reduction, toxicity reduction, recycling and reuse, composting, waste-to-energy combustion, and landfilling—they explore each technology and examine its problems, costs, and legal and social ramifications.

A new way of thinking about data science and data ethics that is informed by the ideas of intersectional feminism. Today, data science is a form of power. It has been used to expose injustice, improve health outcomes, and topple governments. But it has also been used to discriminate, police, and surveil. This potential for good, on the one hand, and harm, on the other, makes it essential to ask: Data science by whom? Data science for whom? Data science with whose interests in mind? The narratives around big data and data science are overwhelmingly white, male, and techno-heroic. In Data Feminism, Catherine D'Ignazio and Lauren Klein present a new way of thinking about data science and data ethics—one that is informed by intersectional feminist thought. Illustrating data feminism in action, D'Ignazio and Klein show how challenges to the male/female binary can help challenge other hierarchical (and empirically wrong) classification systems. They explain how, for example, an understanding of emotion can expand our ideas about effective data visualization, and how the concept of invisible labor can expose the significant human efforts required by our automated systems. And they show why the data never, ever "speak for themselves." Data Feminism offers strategies for data scientists seeking to learn how feminism can help them work toward justice, and for feminists who want to focus their efforts on the growing field of data science. But Data Feminism is about much more than gender. It is about power, about who has it and who doesn't, and about how those differentials of power can be challenged and changed.

Port Business is essential reading for all those with an interest in trade and transportation and the role of ports in the global supply chain. It discusses the various types of ports in existence, identifies the major ports per category, analyzes what the key business drivers are, describes their governance, how they are managed, which trends influence them, and what kind of impact they have on supply chains. Dr. Jurgen Sorgenfrei uses his significant consulting and project development experience within the international ports, shipping, rail & logistics sector, and in global economics, trade, analytics, and forecasting as well as in intermodal hinterland transport to provide this comprehensive overview of port management. The book is a combination of a strong background in principles and practical knowledge and is an indispensable resource for those interested in maritime economics.

In August 1964, thousands of Simba rebels attacked and captured the city of Stanleyville in the newly independent Republic of the Congo and took more than 1,600 European and American residents as hostages, threatening to kill them if any attempt was made to recapture the city. In November of that year, after months of increasingly tense and complex discussions among the governments whose nationals were being held, an airborne assault by Belgian paracommandos dropped by American Air Force planes, combined with a CIA-piloted air strike against the Stanleyville airport, liberated most of the hostages, but only after a Simba-initiated massacre. "Dragon Operations: Hostage Rescues in the Congo, 1964-1965" provides both the political background to these events and a detailed account of the actual operations: Dragon Rouge, the operations in Stanleyville, and Dragon Noir, focused on the city of Pailis, several hundred miles away. The book highlights the difficulties in organizing an international rescue effort with insufficient joint planning and inadequate command and control among the Belgian and American forces, as well as their differing political ideas and goals. The ad hoc nature of the planning was exemplified by an initial American Special Forces plan to air drop its forces east of Stanleyville and float down the river to Stanleyville. This plan was aborted when it was pointed out that the existence of Stanley Falls between the drop zone and the city was an insuperable obstacle. The operation also suffered from the Belgian commander's colonial-era contempt for the numerical strength of the Simbas and American fears of what was in reality a non-existent Communist element in the rebel movement. "Dragon Operations" demonstrates that, despite the slapdash nature of their planning and communications aspects, as well as the distance involved, the austere support, the large number of hostages, and a lack of intelligence data, they were remarkably successful in rescuing most of the hostages. Although less than ideal, the operations worked better than expected, given the conditions under which they were conducted. This important study of an almost forgotten episode of the Cold War has much to offer to military strategists and tacticians, political scientists and students of contemporary history alike.
